# THE CONES ASSOCIATED TO SOME TRANSVERSAL POLYMATROIDS 

## Alin Ştefan

#### Abstract

In this paper we describe the facets cone associated to transversal polymatroid presented by $\mathcal{A}=\{\{1,2\},\{2,3\}, \ldots,\{n-1, n\},\{n, 1\}\}$. Using the Danilov-Stanley theorem to characterize the canonicale module, we deduce that the base ring associated to this polymatroid is Gorenstein ring. Also, starting from this polymatroid we describe the transversal polymatroids with Gorenstein base ring in dimension 3 and with the help Normaliz in dimension 4.

## 1 Preliminaries on polyhedral geometry

An affine space generated by $A \subset \mathbb{R}^{n}$ is a translation of a linear subspace of $\mathbb{R}^{n}$. If $0 \neq a \in \mathbb{R}^{n}$, then $H_{a}$ will denote the hyperplane of $\mathbb{R}^{n}$ through the origin with normal vector $a$, that is,

$$
H_{a}=\left\{x \in \mathbb{R}^{n} \mid<x, a>=0\right\}
$$

where $<,>$ is the usual inner product in $\mathbb{R}^{n}$. The two closed half spaces bounded by $H_{a}$ are:

$$
H_{a}^{+}=\left\{x \in \mathbb{R}^{n} \mid<x, a>\geq 0\right\} \text { and } H_{a}^{-}=\left\{x \in \mathbb{R}^{n} \mid<x, a>\leq 0\right\}
$$

Recall that a polyhedral cone $Q \subset \mathbb{R}^{n}$ is the intersection of a finite number of closed subspaces of the form $H_{a}^{+}$. If $A=\left\{\gamma_{1}, \ldots, \gamma_{r}\right\}$ is a finite set of points in $\mathbb{R}^{n}$ the cone generated by $A$, denoted by $\mathbf{R}_{+} A$, is defined as

$$
\mathbf{R}_{+} A=\left\{\sum_{i=1}^{r} a_{i} \gamma_{i} \mid a_{i} \in \mathbb{R}_{+}, \text {with } 1 \leq i \leq n\right\}
$$

[^0]An important fact is that $Q$ is a polyhedral cone in $\mathbb{R}^{n}$ if and only if there exists a finite set $A \subset \mathbb{R}^{n}$ such that $Q=\mathbf{R}_{+} A$, see ([15],theorem 4.1.1.).

Definition 1.1. A proper face of a polyhedral cone is a subset $F \subset Q$ such that there is a supporting hyperplane $H_{a}$ satisfying:

1) $F=Q \cap H_{a} \neq \emptyset$;
2) $Q \nsubseteq H_{a}$ and $Q \subset H_{a}^{+}$.

Definition 1.2. A proper face $F$ of a polyhedral cone $Q \subset \mathbb{R}^{n}$ is called a facet of $Q$ if $\operatorname{dim}(F)=\operatorname{dim}(Q)-1$.

## 2 Polymatroids

Let $K$ be an infinite field, $n$ and $m$ be positive integers, $[n]=\{1,2, \ldots, n\}$. A nonempty finite set $B$ of $\mathbf{N}^{n}$ is the base set of a discrete polymatroid $\mathcal{P}$ if, for all $u=\left(u_{1}, u_{2}, \ldots, u_{n}\right), v=\left(v_{1}, v_{2}, \ldots, v_{n}\right) \in B$, one has $u_{1}+u_{2}+\ldots+u_{n}=$ $v_{1}+v_{2}+\ldots+v_{n}$ and, for all $i$ such that $u_{i}>v_{i}$, there exists $j$ such that $u_{j}<v_{j}$ and $u+e_{j}-e_{i} \in B$, where $e_{k}$ denotes the $k^{t h}$ vector of the standard basis of $\mathbf{N}^{n}$. The notion of discrete polymatroid is a generalization of the classical notion of matroid, see [6] [9] [8] [16]. Associated with the base $B$ of a discret polymatroid $\mathcal{P}$ one has a $K$-algebra $K[B]$ - called the base ring of $\mathcal{P}$ - defined to be the $K$-subalgebra of the polynomial ring in $n$ indeterminates $K\left[x_{1}, x_{2}, \ldots, x_{n}\right]$ generated by the monomials $x^{u}$ with $u \in B$. From [9], the algebra $K[B]$ is known to be normal and hence Cohen-Macaulay.

If $A_{i}$ are some non-empty subsets of $[n]$, for $1 \leq i \leq m, \mathcal{A}=\left\{A_{1}, A_{2}, \ldots, A_{m}\right\}$, then the set of the vectors $\sum_{k=1}^{m} e_{i_{k}}$ with $i_{k} \in A_{k}$, is the base of a polymatroid, called transversal polymatroid presented by $\mathcal{A}$. The base ring of a transversal polymatroid presented by $\mathcal{A}$ denoted by $K[\mathcal{A}]$ is the ring :

$$
K[\mathcal{A}]:=K\left[x_{i_{1}} x_{i_{2}} \ldots x_{i_{m}}: i_{j} \in A_{j}, 1 \leq j \leq m\right]
$$

## 3 Some Linear Algebra

Let $n \in \mathbf{N}$ be an integer number, $n \geq 3$ and let be given the following set with $2 n-3$ points with positive integer coordinates :
$\left\{R_{0,1}(2,1,1, \ldots, 1,1,0), R_{0,2}(2,1,1, \ldots, 1,0,1), \ldots, R_{0, n-2}(2,1,0, \ldots, 1,1,1)\right.$,

$$
\begin{aligned}
& R_{0, n-1}(2,0,1, \ldots, 1,1,1), Q_{0,1}(1,2,1,1, \ldots, 1,1,0), Q_{0,2}(1,1,2,1, \ldots, 1,1,0) \\
& \left.\quad \ldots \ldots, Q_{0, n-3}(1,1,1,1, \ldots, 2,1,0), Q_{0, n-2}(1,1,1,1, \ldots, 1,2,0)\right\} \subset \mathbf{N}^{n}
\end{aligned}
$$

We shall denote by $A_{1} \in M_{n-1, n}(\mathbb{R})$ the matrix with rows the coordinates of points $\left\{R_{0,1}, R_{0,2}, \ldots, R_{0, n-1}\right\}$ and for $2 \leq i \leq n-1, A_{i} \in M_{n-1, n}(\mathbb{R})$ the matrix with rows the coordinates of the points

$$
\left\{R_{0,1}, \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\}
$$

that is:

$$
A_{1}=\left(\begin{array}{ccccccccc}
2 & 1 & 1 & 1 & \ldots & \ldots & 1 & 1 & 0 \\
2 & 1 & 1 & 1 & \ldots & \ldots & 1 & 0 & 1 \\
2 & 1 & 1 & 1 & \ldots & \ldots & 0 & 1 & 1 \\
. & . & . & . & . & . & . & . & . \\
2 & 1 & 1 & 0 & \ldots & \ldots & 1 & 1 & 1 \\
2 & 1 & 0 & 1 & \ldots & \ldots & 1 & 1 & 1 \\
2 & 0 & 1 & 1 & \ldots & \ldots & 1 & 1 & 1
\end{array}\right)
$$

and, for $2 \leq i \leq n-1$,

$$
A_{i}=\left(\begin{array}{ccccccccccc}
2 & 1 & 1 & \ldots & 1 & 1 & 1 & \ldots & 1 & 1 & 0 \\
2 & 1 & 1 & \ldots & 1 & 1 & 1 & \ldots & 1 & 0 & 1 \\
2 & 1 & 1 & \ldots & 1 & 1 & 1 & \ldots & 0 & 1 & 1 \\
. & . & . & \ldots & . & . & . & \ldots & . & . & . \\
2 & 1 & 1 & \ldots & 1 & 1 & 0 & \ldots & 1 & 1 & 1 \\
1 & 2 & 1 & \ldots & 1 & 1 & 1 & \ldots & 1 & 1 & 0 \\
1 & 1 & 2 & \ldots & 1 & 1 & 1 & \ldots & 1 & 1 & 0 \\
. & . & . & \ldots & . & . & . & \ldots & . & . & . \\
1 & 1 & 1 & \ldots & 2 & 1 & 1 & \ldots & 1 & 1 & 0 \\
1 & 1 & 1 & \ldots & 1 & 2 & 1 & \ldots & 1 & 1 & 0
\end{array}\right) \leftarrow(n-i+1)^{t h} \text { column row } .
$$

Let $T_{i}$ be the linear transformation from $\mathbb{R}^{n}$ into $\mathbb{R}^{n-1}$ defined by $T_{i}(x)=A_{i} x$ for all $1 \leq i \leq n-1$.

Let $i, j \in \mathbf{N}, 1 \leq i, j \leq n$. We denote by $e_{i, j}$ the matrix in $M_{n-1}(\mathbb{R})$ with the entries: 1 , for the $(i, j)$-entry, and 0 for the other entries. We denote by $T_{i, j}(a)$ the matrix

$$
T_{i, j}(a)=I_{n-1}+a e_{i, j} \in M_{n-1}(\mathbb{R})
$$

By $P_{i, j}$ we denote the matrix in $M_{n-1}(\mathbb{R})$ defined by

$$
P_{i, j}=I_{n-1}-e_{i, i}-e_{j, j}+e_{i, j}+e_{j, i}
$$

Lemma 3.1. a) The set of points $\left\{R_{0,1}, \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\}$, for $2 \leq i \leq n-1$ and $\left\{R_{0,1}, R_{0,2}, \ldots, R_{0, n-1}\right\}$ are linearly independent. b) For $1 \leq i \leq n-1$, the equations of the hyperplanes generated by the points $\left\{O, R_{0,1}, R_{0,2} \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\}$ are :

$$
H_{[i]}:=-(n-i-1) \sum_{j=1}^{i} x_{j}+(i+1) \sum_{j=i+1}^{n} x_{j}=0
$$

where $[i]$ is the set $[i]:=\{1, \ldots, i\}$.
Proof. a) The set of points are linearly independent if the matrices with rows the coordinates of the points have the rank $n-1$.
Using elementary row transformations on the matrix $A_{1}$, we have:
$B_{1}=U_{1} A_{1}$, where $U_{1} \in M_{n-1}(\mathbb{R})$ is given by:

$$
U_{1}=\prod_{2 \leq i \leq\left\lfloor\frac{n}{2}\right\rfloor} P_{i, n-i+1} \prod_{i=2}^{n-1} T_{n-i+1,1}(-1)
$$

and $\lfloor c\rfloor$ is the greatest integer $\leq c$. So $B_{1}$ is :

$$
B_{1}=\left(\begin{array}{ccccccccc}
2 & 1 & 1 & 1 & \ldots & \ldots & 1 & 1 & 0 \\
0 & -1 & 0 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
0 & 0 & -1 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
. & . & . & . & . & . & . & . & . \\
0 & 0 & 0 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
0 & 0 & 0 & 0 & \ldots & \ldots & -1 & 0 & 1 \\
0 & 0 & 0 & 0 & \ldots & \ldots & 0 & -1 & 1
\end{array}\right)
$$

For $2 \leq i \leq n-1$, using elementary row transformations on the matrix $A_{i}$, we have: $B_{i}=U_{i} A_{i}$, where $U_{i} \in M_{n-1}(\mathbb{R})$,

$$
\begin{gathered}
U_{i}=\left[\prod_{j=i}^{n-2}\left(\prod_{k=1}^{i-1}\right) P_{n-j+k-1, n-j+k}\right]\left[\prod_{k=2}^{i-1}\left(\prod_{j=n-i+k}^{n-1} T_{j, n-i+k-1}\left(-\frac{1}{k+1}\right)\right)\right] . \\
\cdot\left(\prod_{j=n-i+1}^{n-1} T_{j, 1}\left(-\frac{1}{2}\right)\right)\left(\prod_{j=1}^{n-i} T_{j, 1}(-1)\right),
\end{gathered}
$$

and so $B_{i}$ is :

$$
\downarrow(i+1)^{t h} \text { column }
$$

$$
B_{i}=\left(\begin{array}{cccccccccccc}
2 & 1 & 1 & 1 & \ldots & 1 & 1 & 1 & \ldots & 1 & 1 & 0 \\
0 & \frac{3}{2} & \frac{1}{2} & \frac{1}{2} & \ldots & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & \ldots & \frac{1}{2} & \frac{1}{2} & 0 \\
0 & 0 & \frac{4}{3} & \frac{1}{3} & \ldots & \frac{1}{3} & \frac{1}{3} & \frac{1}{3} & \ldots & \frac{1}{3} & \frac{1}{3} & 0 \\
. & . & . & . & \ldots & . & . & & \ldots & & . & . \\
0 & 0 & 0 & 0 & \ldots & \frac{i}{i-1} & \frac{1}{i-1} & \frac{1}{i-1} \ldots & \frac{1}{i-1} & \frac{1}{i-1} & 0 \\
0 & 0 & 0 & 0 & \ldots & 0 & \frac{i+1}{i} & \frac{1}{i} \ldots & \frac{1}{i} & \frac{1}{i} & 0 \\
0 & 0 & 0 & 0 & \ldots & 0 & 0 & -1 \ldots & 0 & 0 & 1 \\
. & . & . & . & \ldots & . & . & \ldots & . & . & . \\
0 & 0 & 0 & 0 & \ldots & 0 & 0 & 0 & \ldots & 1 & 0 & 1 \\
0 & 0 & 0 & 0 & \ldots & 0 & 0 & 0 & \ldots & 0 & -1 & 1
\end{array}\right) \leftarrow i^{\text {th }} \text { row } .
$$

Since the rank of $B_{i}$ is $n-1$, the rank of $A_{i}$ is $n-1$, for all $1 \leq i \leq n-1$.
$b)$ The hyperplane generated by the points

$$
\left\{R_{0,1}, \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\}
$$

has the normal vector the generator of the subspace $\operatorname{Ker}\left(T_{i}\right)$.
For $1 \leq i \leq n-1$, using $a$ ), we obtain that

$$
\operatorname{Ker}\left(T_{i}\right)=\left\{x \in \mathbb{R}^{n} \mid T_{i}(x)=0\right\}=\left\{x \in \mathbb{R}^{n} \mid A_{i} x=0\right\}=\left\{x \in \mathbb{R}^{n} \mid B_{i} x=0\right\}
$$

that is

$$
x_{n}=x_{n-1}=\ldots=x_{i+1}=(i+1) \alpha
$$

and

$$
x_{i}=x_{i-1}=\ldots=x_{1}=-(n-i-1) \alpha
$$

where $\alpha \in \mathbb{R}$.
Thus, for $1 \leq i \leq n-1$, the equations of the hyperplanes generated by the points $\left\{R_{0,1}, \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\}$ are :

$$
H_{[i]}:=-(n-i-1) \sum_{j=1}^{i} x_{j}+(i+1) \sum_{j=i+1}^{n} x_{j}=0 .
$$

For $1 \leq k \leq n-1$, we define two types of sets of points:
1)

$$
\left\{R_{k, 1}, R_{k, 2}, \ldots, R_{k, n-1}\right\}
$$

is the set of points whose coordinates are the rows of the matrix $A_{1} P_{1 k+1}$;
2)

$$
\left\{Q_{k, 1}, Q_{k, 2}, \ldots, Q_{k, n-2}\right\}
$$

is the set of points whose coordinates are the rows of the matrix $Q M^{k}$, where $M$ is the matrix

$$
M \in M_{n}(\mathbb{R}), M=\prod_{i=1}^{n-1} P_{n-i, n-i+1}
$$

and $Q \in M_{n-2, n}(\mathbb{R})$ is the matrix with rows the coordinates of points $\left\{Q_{1}, Q_{2}, \ldots, Q_{n-2}\right\}$.

For every $1 \leq i \leq n-1$, we shall denote by $\nu_{[i]}$ the normal of the hyperplane $H_{[i]}$ :

$$
\downarrow i^{\text {th }} \text { column }
$$

$\nu_{[i]}=(-(n-i-1), \quad \ldots \quad,-(n-i-1), \quad(i+1), \quad \ldots \quad,(i+1)) \in \mathbb{R}^{n}$.
For $i=1$, we denote by $H_{\{k+1\}}$ the hyperplane having the normal :

$$
\nu_{\{k+1\}}:=\nu_{[i]} P_{1, k+1}=\nu_{[1]} P_{1, k+1},
$$

for all $1 \leq k \leq n-1$.
For $2 \leq i \leq n-1$ and $1 \leq k \leq n-1$, we denote by $H_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}}$ the hyperplane which has the normal :

$$
\nu_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}}:=\nu_{[i]} M^{k}
$$

where $\sigma \in S_{n}$ is the product of transpositions :

$$
\sigma:=\prod_{i=1}^{n-1}(i, i+1)
$$

Lemma 3.2. a) For $1 \leq k \leq n-1$ and $2 \leq i \leq n-1$, the set of points $\left\{R_{k, 1}, \ldots, R_{k, n-i}, Q_{k, 1}, Q_{k, 2}, \ldots, Q_{k, i-1}\right\}$ and $\left\{R_{k, 1}, R_{k, 2}, \ldots, R_{k, n-1}\right\}$ are linearly independent.
b) For $1 \leq k \leq n-1$ and $2 \leq i \leq n-1$, the equation of the hyperplane generated by the points $\left\{O, R_{k, 1}, R_{k, 2} \ldots, R_{k, n-i}, Q_{k, 1}, Q_{k, 2}, \ldots, Q_{k, i-1}\right\}$ is:

$$
H_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}}:=<\nu_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}}, x>=0
$$

where $O$ is zero point, $O(0,0, \ldots, 0)$ and $\sigma \in S_{n}$ is the product of transpositions:

$$
\sigma:=\prod_{i=1}^{n-1}(i, i+1)
$$

For $1 \leq k \leq n-1$, the equation of the hyperplane generated by the points $\left\{O, R_{k, 1}, R_{k, 2} \ldots, R_{k, n-1}\right\}$ is

$$
H_{\{k+1\}}:=<\nu_{\{k+1\}}, x>=0
$$

Proof. a) Since, for any $1 \leq k \leq n-1$, the matrix $P_{1, k+1}, M^{k}$ are invertible and the sets of points

$$
\left\{R_{0,1}, \ldots, R_{0, n-i}, Q_{0,1}, Q_{0,2}, \ldots, Q_{0, i-1}\right\},\left\{R_{0,1}, R_{0,2}, \ldots, R_{0, n-1}\right\}
$$

are linearly independent then the set of points

$$
\left\{R_{k, 1}, \ldots, R_{k, n-i}, Q_{k, 1}, Q_{k, 2}, \ldots, Q_{k, i-1}\right\},\left\{R_{k, 1}, R_{k, 2}, \ldots, R_{k, n-1}\right\}
$$

are linearly independent.
b) Since, for any $1 \leq k \leq n-1$ and $2 \leq i \leq n-1$, the matrix $M^{k}$ are invertible, then the hyperplane generated by the points

$$
\left\{O, R_{k, 1}, \ldots, R_{k, n-i}, Q_{k, 1}, \ldots, Q_{k, i-1}\right\}
$$

has the normal vector obtained by multiplying the normal vector $\nu_{[k]}$ on the right with $M^{k}$. For any $1 \leq k \leq n-1$, the matrix $P_{1, k+1}$ is invertible, then the hyperplane generated by the points $\left\{O, R_{k, 1}, R_{k, 2} \ldots, R_{k, n-1}\right\}$ has the normal vector obtained by multiplying on the right the normal vector $\nu_{[1]}$ with $P_{1, k+1}$.

Lemma 3.3. Any point $P \in \mathbf{N}^{\mathbf{n}}, n \geq 3$ which lies in the hyperplane $H$ : $x_{1}+x_{2}+\ldots+x_{n}-n=0$ such that its coordinates are in the set $\{0,1,2\}$ and has at least one coordinate equal to 2 lies in the hyperplane $H_{\{k\}}=0$, for an integer $k \in\{1,2, \ldots, n\}$.
Proof. Let $k \in\{1,2, \ldots, n\}$ be the first position of " 2 " that appears in the coordinates of a point $P \in \mathbf{N}^{\mathbf{n}}$. Since the equation of the hyperplane $H_{\{k\}}$ is:

$$
H_{\{k\}}=\sum_{i=1}^{k-1} 2 x_{i}-(n-2) x_{k}+\sum_{i=k+1}^{n} 2 x_{i}=0
$$

it results that

$$
-2(n-2)+2 \sum_{i=1, i \neq k} n a_{i}=-2(n-2)+2(n-2)=0
$$

where $P=\left(a_{1}, a_{2}, \ldots, a_{n}\right) \in H$ with $a_{i} \in\{0,1,2\}$ and which has at least one coordinate equal to 2 .

## 4 The main result

First let us fix some notations that will be used throughout the remaining of this paper. Let $K$ be a field and $K\left[x_{1}, x_{2}, \ldots, x_{n}\right]$ be a polynomial ring with coefficients in $K$. Let $n \geq 2$ be a positive integer and $\mathcal{A}$ be the collection of sets:

$$
\mathcal{A}=\{\{1,2\},\{2,3\}, \ldots,\{n-1, n\},\{n, 1\}\} .
$$

We denote by $K[\mathcal{A}]$ the $K$-algebra generated by $x_{i_{1}} x_{i_{2}} \ldots x_{i_{n}}$, with

$$
i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, \ldots, i_{n-1} \in\{n-1, n\}, i_{n} \in\{1, n\} .
$$

This $K$-algebra represents the base ring associated to transversal polymatroid presented by $\mathcal{A}$.

Given $A \in \mathbf{N}^{\mathbf{n}}$ finite, we define $C_{A}$ as being the subsemigroup of $\mathbf{N}^{n}$ generated by $A$ :

$$
C_{A}=\sum_{\alpha \in A} \mathbf{N} \alpha
$$

thus the cone generated by $C_{A}$ is:

$$
\mathbf{R}_{+} C_{A}=\mathbf{R}_{+} A=\left\{\sum a_{i} \gamma_{i} \mid a_{i} \in \mathbb{R}_{+}, \gamma_{i} \in A\right\}
$$

With this notation, we state our main result:
Theorem 4.1. Let $A=\left\{\log \left(x_{i_{1}} x_{i_{2}} \ldots x_{i_{n}}\right) \mid i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, \ldots, i_{n-1} \in\right.$ $\left.\{n-1, n\}, i_{n} \in\{1, n\}\right\} \subset \mathbf{N}^{n}$ the exponent set of the generators of $K$-algebra $K[\mathcal{A}]$ and $N=\left\{\nu_{\{k+1\}}, \nu_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}} \mid 0 \leq k \leq n-1,2 \leq i \leq n-1\right\}$, then

$$
\mathbf{R}_{+} C_{A}=\bigcap_{a \in N} H_{a}^{+}
$$

such that $H_{a}^{+}$with $a \in N$ are just the facets of the cone $\mathbf{R}_{+} C_{A}$.
Proof. Since $A=\left\{\log \left(x_{i_{1}} x_{i_{2}} \ldots x_{i_{n}}\right) \mid i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, \ldots, i_{n-1} \in\right.$ $\left.\{n-1, n\}, i_{n} \in\{1, n\}\right\} \subset \mathbf{N}^{\mathbf{n}}$ is the exponent set of the generators of $K$-algebra $K[\mathcal{A}]$, then the set $\left\{R_{0,1}, R_{0,2}, \ldots, R_{0, n-2}, R_{0, n-1}, I\right\} \subset A$, where $I(1,1, \ldots, 1) \in \mathbf{N}^{n}$.

## First step.

We must show that the dimension of the cone $\mathbf{R}_{+} C_{A}$ is $\operatorname{dim}\left(\mathbf{R}_{+} C_{A}\right)=n$. We denote by $\widetilde{A} \in M_{n}(\mathbb{R})$ the matrix with rows the coordinates of the points
$\left\{R_{0,1}, R_{0,2}, \ldots, R_{0, n-2}, R_{0, n-1}, I\right\}$. Using elementary row transformations to the matrix $\widetilde{A}$, we have: $\widetilde{B}=\widetilde{U} \widetilde{A}$, where $\widetilde{U} \in M_{n}(\mathbb{R})$ is an invertible matrix:

$$
\left.\widetilde{U}=\left(\prod_{i=2}^{n-1} T_{n-i+1,1}(-1)\right)\right)\left(T_{n, 1}\left(-\frac{1}{2}\right)\right)\left(\prod_{2 \leq i \leq\left\lfloor\frac{n}{2}\right\rfloor} P_{i, n-i+1}\right)\left(\prod_{i=2}^{n-1} T_{n, n-i+1}\left(\frac{1}{2}\right)\right)
$$

where $\lfloor c\rfloor$ is the greatest integer $\leq c$.
So $\widetilde{B}$ is:

$$
\widetilde{B}=\left(\begin{array}{ccccccccc}
2 & 1 & 1 & 1 & \ldots & \ldots & 1 & 1 & 0 \\
0 & -1 & 0 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
0 & 0 & -1 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
. & . & . & . & . & . & . & . & . \\
0 & 0 & 0 & 0 & \ldots & \ldots & 0 & 0 & 1 \\
0 & 0 & 0 & 0 & \ldots & \ldots & -1 & 0 & 1 \\
0 & 0 & 0 & 0 & \ldots & \ldots & 0 & -1 & 1 \\
0 & 0 & 0 & 0 & \ldots & \ldots & 0 & 0 & \frac{n}{2}
\end{array}\right) .
$$

Then the dimension of the cone $\mathbf{R}_{+} C_{A}$ is:

$$
\operatorname{dim}\left(\mathbf{R}_{+} C_{A}\right)=\operatorname{rank}(\widetilde{A})=\operatorname{rank}(\widetilde{B})=n
$$

since $\operatorname{det}(\widetilde{B})=(-1)^{n} n$.

## Second step.

We must show that $H_{a} \cap \mathbf{R}_{+} C_{A}$ with $a \in N$ are precisely the facets of the cone $\mathbf{R}_{+} C_{A}$. This is equivalent to show that $\mathbf{R}_{+} C_{A} \subset H_{a}^{+}$and $\operatorname{dim} H_{a} \cap$ $\mathbf{R}_{+} C_{A}=n-1 \forall a \in N$.
The fact that $\operatorname{dim}_{a} \cap \mathbf{R}_{+} C_{A}=n-1 \forall a \in N$ it is clear, from Lemma 3.1 and Lemma 3.2.

For $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor$ and $1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n$, let

$$
I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}=I+\left(e_{i_{1}}-e_{i_{2}}\right)+\left(e_{i_{3}}-e_{i_{4}}\right)+\ldots+\left(e_{i_{2 k-1}}-e_{i_{2 k}}\right)
$$

and

$$
I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}=I+\left(e_{i_{2}}-e_{i_{1}}\right)+\left(e_{i_{4}}-e_{i_{3}}\right)+\ldots+\left(e_{i_{2 k}}-e_{i_{2 k-1}}\right)
$$

where $I=I(1,1, \ldots, 1) \in \mathbf{N}^{n}$ and $e_{i}$ is the $i^{t h}$ unit vector.
We set

$$
A^{\prime}=\left\{I, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime} \left\lvert\, 1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor\right.\right.
$$

$$
\text { and } \left.1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n\right\}
$$

We claim that $A=A^{\prime}$.
Let

$$
m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}=\prod_{s=1}^{\left\lfloor\frac{n}{2}\right\rfloor} m_{s}, m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}=\prod_{s=1}^{\left\lfloor\frac{n}{2}\right\rfloor} m_{s}^{\prime}
$$

where

$$
\begin{aligned}
m_{s} & =x_{k_{i_{2 s-2}+1}} \ldots x_{k_{i_{2 s-1}-2}} x_{i_{2 s-1}}^{2} x_{k_{i_{2 s-1}+1}} \ldots x_{k_{i_{2 s}-2}} x_{i_{2 s}-1} x_{i_{2 s}+1} \\
m_{s}^{\prime} & =x_{k_{i_{2 s-2}+1}} \ldots x_{k_{i_{2 s-1}-2}} x_{i_{2 s-1}-1} x_{i_{2 s-1}+1} x_{k_{i_{2 s-1}+1}} \ldots x_{k_{i_{2 s}-2}} x_{i_{2 s}}^{2}
\end{aligned}
$$

for all $1 \leq k, s \leq\left\lfloor\frac{n}{2}\right\rfloor, i_{0}=0$ and $k_{j} \in\{j, j+1\}$, for $1 \leq j \leq n$. Evidently $\log \left(m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}\right), \log \left(m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}\right) \in A$.

Since

$$
\log \left(m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}\right)=I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}
$$

and

$$
\log \left(m_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}\right)=I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}
$$

for all $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor$ and $1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n$, then $A^{\prime} \subset A$.
But the cardinal of $A$ is $\sharp(A)=2^{n}-1$ and since

$$
\sum_{s=1}^{\left\lfloor\frac{n}{2}\right\rfloor}\binom{n}{2 s}=2^{n-1}-1
$$

the cardinal of $A^{\prime}$ is:

$$
\sharp\left(A^{\prime}\right)=1+2 \sum_{s=1}^{\left\lfloor\frac{n}{2}\right\rfloor}\binom{n}{2 s}=2^{n}-1 .
$$

Thus $A=A^{\prime}$.
Now we start to prove that $\mathbf{R}_{+} C_{A} \subset H_{a}^{+}$for all $a \in N$. Note that

$$
<\nu_{\{p+1\}}, I>=<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I>=n>0
$$

for any $0 \leq p \leq n-1,1 \leq i \leq n-1$.
Let $0 \leq p \leq n-1$. We claim that:

$$
<\nu_{\{p+1\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>\geq 0 \text { and }<\nu_{\{p+1\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}>\geq 0
$$

for any $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor$ and $1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n$.
We prove the first inequality. The proof of the second inequality will be similar. We have three possibilities:

1) If $<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{p+1}>=0$, then $<\nu_{\{p+1\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=2 n>0$;
2) If $\left\langle I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{p+1}\right\rangle=1$ then $<\nu_{\{p+1\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=n>0$;
3) If $<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{p+1}>=2$ then $<\nu_{\{p+1\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=0$.

Let $0 \leq p \leq n-1$ and $2 \leq i \leq n-1$ be fixed.
We claim that:

$$
<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>\geq 0
$$

and

$$
<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}>\geq 0
$$

for any $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor$ and $1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n$.
We prove the first inequality. The proof of the second inequalities is analogous.
We have:

$$
\begin{gathered}
<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=H_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}\left(I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}\right)= \\
=-(n-i-1) \sum_{s=1}^{i}<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{\sigma^{p}(s)}>+ \\
\quad+(i+1) \sum_{s=i+1}^{n}<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{\sigma^{p}(s)}>
\end{gathered}
$$

Let

$$
\Gamma=\left\{s \mid<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{\sigma^{p}(s)}>=2,1 \leq s \leq i\right\}
$$

be the set of indices of $I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}$, where the coordinates are equal to 2 .
If the cardinal of $\Gamma$ is zero, then there exists at most an index $i_{2 t-1} \in$ $\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$ with $1 \leq t \leq\left\lfloor\frac{n}{2}\right\rfloor$. Otherwise we have two possibilities:
1)There exist at least two indices $i_{2 t-1}, i_{2 t_{1}-1} \in\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$, with $1 \leq t<t_{1} \leq\left\lfloor\frac{n}{2}\right\rfloor$ and, since $\sigma^{p}(s)=(p+s) \bmod n$, then there exists $1 \leq t_{2} \leq\left\lfloor\frac{n}{2}\right\rfloor$ such that $i_{2 t_{2}} \in\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$ and thus $<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{\sigma^{p}\left(i_{2 t_{2}}\right)}>=2$, which it is false.
2) There exist at least two indices $i_{2 t-1}, i_{2 t_{1}} \in\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$, with $1 \leq t, t_{1} \leq\left\lfloor\frac{n}{2}\right\rfloor$. Then as in the first case, we have $<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, e_{\sigma^{p}\left(i_{2 t_{1}}\right)}>=$ 2 , which it is false.
If for any $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor, i_{2 k-1} \notin\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$, then
$<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=-(n-i-1) i+(i+1)(n-i)=n>0$.

When there exists just one index $i_{2 t-1} \in\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}$ with $1 \leq$ $t \leq\left\lfloor\frac{n}{2}\right\rfloor$, then

$$
\begin{gathered}
<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
=-(n-i-1)(i-1)+(i+1)(n-i+1)=2 n>0 .
\end{gathered}
$$

If the cardinal of $\Gamma$, is $\sharp(\Gamma)=t \geq 1$, then we have two possibilities:

1) If

$$
\left\{1 \leq i_{1}<i_{2}<\ldots<i_{2 t-3}<i_{2 t-2}<i_{2 t-1} \leq n\right\} \subset\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}
$$

then we have:
$<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=-(n-i-1)(i+1)+(i+1)(n-i-1)=0$.
2) If

$$
\left\{1 \leq i_{1}<i_{2}<\ldots<i_{2 t-1}<i_{2 t} \leq n\right\} \subset\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}
$$

then we have:
$<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=-(n-i-1)(i)+(i+1)(n-i)=n>0$.
Thus we have:

$$
\mathbf{R}_{+} C_{A} \subset \bigcap_{a \in N} H_{a}^{+}
$$

Finally let us prove the converse inclusion.
This is equivalent with the fact that the extremal rays of the cone

$$
\bigcap_{a \in N} H_{a}^{+}
$$

are in $\mathbf{R}_{+} C_{A}$.
Let $1 \leq k \leq\left\lfloor\frac{n}{2}\right\rfloor, 1 \leq i_{1}<i_{2}<\ldots<i_{2 k-1}<i_{2 k} \leq n$. We consider the following hyperplanes:
a) $H_{\left\{\left[i_{2 s-1}\right] \backslash[j]\right\}}$ if $j \in\left\{i_{2 s-2}, \ldots i_{2 s-1}-1\right\}$ and $1 \leq s \leq k$,
b) $H_{\left\{\left[j \backslash \backslash i_{2 s-1}-1\right]\right\}}$ if $j \in\left\{i_{2 s-1}+1, \ldots, i_{2 s}-1\right\}$ and $1 \leq s \leq k$,
c) $H_{\left\{\left[i_{2 k-1}\right] \cup([n] \backslash[j])\right\}}$ if $j \in\left\{i_{2 k}, \ldots n-1\right\}$,
d) $H_{\left\{i_{2 s}\right\}}$ for $1 \leq s \leq k-1$; where $[i]:=\{1, \ldots, i\}, i_{0}=0$ and $[0]=\emptyset$.

We claim that the point $I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}$ belongs to these hyperplanes.
a) Let $j \in\left\{i_{2 s-2}, \ldots i_{2 s-1}-1\right\}$ and $1 \leq s \leq k$, then

$$
<H_{\left\{\left[i_{2 s-1}\right] \backslash[j]\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=<H_{\left\{j+1, \ldots, i_{2 s-1}\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=
$$

$$
\begin{gathered}
=<-\left(n-\left(i_{2 s-1}-j\right)-1\right) \\
\sum_{t \in\left\{j+1, \ldots, i_{2 s-1}\right\}} x_{t}+\left(i_{2 s-1}-j+1\right) \sum_{t \in[n] \backslash\left\{j+1, \ldots, i_{2 s-1}\right\}} x_{t}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
=-\left(n-i_{2 s-1}+j-1\right)\left(i_{2 s-1}-j+1\right)+ \\
+\left(i_{2 s-1}-j+1\right)\left(n-\left(i_{2 s-1}-j\right)+1\right)=0,
\end{gathered}
$$

since

$$
\begin{array}{cc}
\downarrow j+1^{t h} & \downarrow i_{2 s-1}^{t h} \\
I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}=(\ldots, 1, \ldots, 1,2, \ldots)
\end{array}
$$

b) Let $j \in\left\{i_{2 s-1}+1, \ldots i_{2 s}-1\right\}$ and $1 \leq s \leq k$. Then

$$
\begin{gathered}
<H_{\left\{[j] \backslash\left[i_{2 s-1}-1\right]\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
=<H_{\left\{i_{2 s-1}, \ldots, j\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=<-\left(n-\left(j-i_{2 s-1}+1\right)-1\right) \\
\sum_{t \in\left\{i_{2 s-1}, \ldots, j\right\}} x_{t}+\left(j-i_{2 s-1}+1+1\right) \sum_{t \in[n] \backslash\left\{i_{2 s-1}, \ldots, j\right\}} x_{t}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
=-\left(n-\left(j-i_{2 s-1}+1\right)-1\right)\left(j-i_{2 s-1}+1+1\right)+ \\
+\left(j-i_{2 s-1}+1+1\right)\left(n-\left(j-i_{2 s-1}+1+1\right)\right)=0
\end{gathered}
$$

since

$$
\begin{gathered}
\downarrow i_{2 s-1}^{t h} \\
I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}=\left(\ldots j^{t h}\right. \\
\hline
\end{gathered}
$$

c) Let $j \in\left\{i_{2 k}, \ldots n-1\right\}$. Then

$$
\begin{aligned}
& <H_{\left\{\left[i_{2 k-1}\right] \cup([n] \backslash[j])\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>=<H_{\left\{1, \ldots, i_{2 k-1}, j+1, \ldots, n\right\}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
& =<-\left(n-\left(i_{2 k-1}+n-j\right)-1\right) \\
& \sum_{\left.t \in\left[i_{2 k-1}\right] \cup([n] \backslash \backslash j]\right)} x_{t}+\left(i_{2 k-1}+n-j+1\right) \sum_{t \in\left\{i_{2 k-1}+1, \ldots, j\right\}} x_{t}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}>= \\
& =-\left(j-i_{2 k-1}-1\right)\left(i_{2 k-1}+n-j+1\right)+\left(i_{2 k-1}+n-j+1\right)\left(j-\left(i_{2 k-1}+1\right)+1-1\right)=0,
\end{aligned}
$$

since

$$
\downarrow i_{2 k-1}^{t h} \quad \downarrow i_{2 k}^{t h} \quad \downarrow j+1^{t h}
$$

$$
I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}=(\ldots, \quad 2, \quad 1, \ldots, \quad 1, \quad 0, \quad 1, \ldots, 1, \ldots, 1)
$$

d) It is clear from Lemma 3.3.

Since the number of hyperplanes is

$$
\begin{gathered}
\sum_{s=1}^{k}\left(i_{2 s-1}-1-i_{2 s-2}+1\right)+\sum_{s=1}^{k}\left(i_{2 s}-1-\left(i_{2 s-1}+1\right)+1\right)+\left(n-1-i_{2 k}+1\right)+k-1= \\
=\sum_{s=1}^{k}\left(i_{2 s}-i_{2 s-2}\right)-k+n-i_{2 k}+k-1=n-1
\end{gathered}
$$

then

$$
\left.\begin{array}{l}
\bigcap_{s=1}^{k}\left(\bigcap_{j=i_{2 s-2}}^{i_{2 s-1}-1}\left(H_{\left\{\left[i_{2 s-1}\right] \backslash[j]\right.}\right) \cap \bigcap_{j=i_{2 s-1}+1}^{i_{2 s}-1}\left(H_{\left\{[j] \backslash\left[i_{2 s-1}-1\right]\right\}}\right)\right) \cap \\
\bigcap_{j=i_{2 k}}^{n-1}\left(H_{\left\{\left[i_{2 k-1}\right]\right.} \cup([n] \backslash[j])\right\}
\end{array}\right) \cap \bigcap_{s=1}^{k-1}\left(H_{\left\{i_{2 s}\right\}}\right)=O I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}} .
$$

is an extremal ray of the cone $\bigcap_{a \in N} H_{a}^{+}$. But

$$
O I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}} \in \mathbf{R}_{+} C_{A}
$$

Thus

$$
\bigcap_{a \in N} H_{a}^{+}=\mathbf{R}_{+} C_{A}
$$

For using bellow, we recall that $K$-algebra $K[\mathcal{A}]$ is a normal domain according to [9].

Definition 4.2. Let $R$ be a polynomial ring over a field $K$ and $F$ be a finite set of monomials in $R$. A decomposition

$$
K[F]=\bigoplus_{i=0}^{\infty} K[F]_{i}
$$

of the $K$ - vector space $K[F]$ is an admissible grading if $k[F]$ is a positively graded $K$ - algebra with respect to this decomposition and each component $K[F]_{i}$ has a finite $K$ - basis consisting of monomials.

Theorem 4.3 (Danilov, Stanley). Let $R=K\left[x_{1}, \ldots, x_{n}\right]$ be a polynomial ring over a field $K$ and $F$ be a finite set of monomials in $R$. If $K[F]$ is normal, then the canonical module $\omega_{K[F]}$ of $K[F]$, with respect to an arbitrary admissible grading, can be expressed as an ideal of $K[F]$ generated by monomials

$$
\omega_{K[F]}=\left(\left\{x^{a} \mid a \in \mathbf{N} A \cap r i\left(\mathbf{R}_{+} A\right)\right\}\right)
$$

where $A=\log (F)$ and ri $\left(\mathbf{R}_{+} A\right)$ denotes the relative interior of $\mathbf{R}_{+} A$.
Corollary 4.4. The canonical module $\omega_{K[\mathcal{A}]}$ of $K[\mathcal{A}]$ is

$$
\omega_{K[\mathcal{A}]}=\left(x_{1} x_{2} \ldots x_{n}\right) K[\mathcal{A}]
$$

Thus the $K$ - algebra $K[\mathcal{A}]$ is a Gorenstein ring.
Proof. Since

$$
<\nu_{\{p+1\}}, I>=<\nu_{\left\{\sigma^{p}(1), \sigma^{p}(2), \ldots, \sigma^{p}(i)\right\}}, I>=n>0
$$

for any $0 \leq p \leq n-1,1 \leq i \leq n-1$ and since for any $I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}$ there exist two hyperplanes $H_{a}, H_{a^{\prime}}$ with $a, a^{\prime} \in N$ such that

$$
<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}, H_{a}>=<I_{i_{1} i_{2} \ldots i_{2 k-1} i_{2 k}}^{\prime}, H_{a^{\prime}}>=0
$$

then $I \in \operatorname{ri}\left(\mathbf{R}_{+} C_{A}\right)$ is the only point in relative interior of the cone $\mathbf{R}_{+} C_{A}$. Thus the canonical module is generated by one generator,

$$
\omega_{K[\mathcal{A}]}=\left(x_{1} x_{2} \ldots x_{n}\right) K[\mathcal{A}]
$$

Therefore the $K-$ algebra $K[\mathcal{A}]$ is a Gorenstein ring.
Conjecture 4.5. Let $n, m \in \mathbf{N}, m \leq n, A_{i} \subseteq[n], 1 \leq i \leq m$, and $\widetilde{\mathcal{A}}=$ $\left\{A_{1}, A_{2}, \ldots, A_{m}\right\}$. We denote

$$
\begin{gathered}
A=\left\{\log \left(x_{i_{1}} x_{i_{2}} \ldots x_{i_{n}}\right) \mid i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, \ldots, i_{n-1} \in\{n-1, n\}, i_{n} \in\{1, n\}\right\}, \\
N=\left\{\nu_{\{k+1\}}, \nu_{\left\{\sigma^{k}(1), \sigma^{k}(2), \ldots, \sigma^{k}(i)\right\}} \mid 0 \leq k \leq n-1,2 \leq i \leq n-1\right\},
\end{gathered}
$$

and

$$
\widetilde{A}=\left\{\log \left(x_{i_{1}} x_{i_{2}} \ldots x_{i_{n}}\right) \mid i_{1} \in A_{1}, i_{2} \in A_{2}, \ldots, i_{n-1} \in A_{n-1}, i_{n} \in A_{n}\right\}
$$

Then the base ring associated to transversal polymatroid presented by $\widetilde{\mathcal{A}}, K[\widetilde{\mathcal{A}}]$, is a Gorenstein ring if and only if there exists $\widetilde{N} \subset N$ such that

$$
\mathbf{R}_{+} C_{\widetilde{A}}=\bigcap_{a \in \widetilde{N}} H_{a}^{+}
$$

and $H_{a}^{+}$with $a \in \tilde{N}$ are just the facets of the cone $\mathbf{R}_{+} C_{\widetilde{A}}$.

## 5 The description of some transversal polymatroids with Gorenstein base ring in dimensions 3 and 4.

## Dimension 3.

We consider the collection of sets $\mathcal{A}=\{\{1,2\},\{2,3\},\{3,1\}\}$. The base ring associated to transversal polymatroid presented by $\mathcal{A}$ is

$$
R=K[\mathcal{A}]=K\left[x_{1}^{2} x_{2}, x_{2}^{2} x_{1}, x_{2}^{2} x_{3}, x_{3}^{2} x_{2}, x_{1}^{2} x_{3}, x_{3}^{2} x_{1}, x_{1} x_{2} x_{3}\right]
$$

From [9], $R$ is a normal ring.
We can see $R=K[Q]$, where
$Q=\mathbb{N}\{(2,1,0),(1,2,0),(0,2,1),(0,1,2),(1,0,2),(2,0,1),(1,1,1)\}$.
Our aim is to describe the facets of $C=\mathbb{R}_{+} Q$.
It is easy to see that $C$ has 6 facets, with the support planes given by the equations:

$$
\begin{gathered}
H_{\{1\}}:-x_{1}+2 x_{2}+2 x_{3}=0, \\
H_{\{2\}}: 2 x_{1}-x_{2}+2 x_{3}=0 \\
H_{\{3\}}: 2 x_{1}+2 x_{2}-x_{3}=0 \\
H_{\{1,2\}}: x_{3}=0 \\
H_{\{2,3\}}: x_{1}=0 \\
H_{\{3,1\}}: x_{2}=0
\end{gathered}
$$

In fact, $C=H_{\{1\}}^{+} \cap H_{\{2\}}^{+} \cap H_{\{3\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{3,1\}}^{+}$. Since $(1,1,1)$ is the only point in $\operatorname{ri}\left(\mathbb{R}_{+} Q\right)$, then, by Danilov-Stanley theorem, $R$ is a Gorenstein ring and $\omega_{R}=R(-(1,1,1))$.

In order to obtain all the Gorenstein polymatroids of dimension 3, we remove sequentially some facets of $C$. For instance, if we remove the facet supported by $H_{\{2\}}$, we obtain a new cone $C^{\prime}=H_{\{1\}}^{+} \cap H_{\{3\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap$ $H_{\{3,1\}}^{+}$. It is easy to note that $C^{\prime}=\mathbb{R}_{+} Q^{\prime}$, where $Q^{\prime}=Q+\mathbb{N}\{(0,3,0)\}$. $Q^{\prime}$ is a saturated semigroup, and moreover, $K\left[Q^{\prime}\right]=K\left[\mathcal{A}^{\prime}\right]$, where $\mathcal{A}^{\prime}=$ $\{\{1,2\},\{1,2,3\},\{2,3\}\}$. The Danilov-Stanley theorem assures us that $R^{\prime}=$ $K\left[Q^{\prime}\right]=K\left[\mathcal{A}^{\prime}\right]$ is still Gorenstein with $\omega_{R^{\prime}}=R^{\prime}(-(1,1,1))$. (Remark. If we remove the facet supported by $H_{\{3\}}$ or $H_{\{1\}}$, instead of the facet supported by $H_{\{2\}}$ we obtain a new set $\mathcal{A}^{\prime}$ which is only a permutation of $1,2,3$.)

Suppose that we remove from $C^{\prime}$ the facet supported by $H_{\{3\}}$. We obtain a new cone $C^{\prime \prime}=H_{\{1\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{3,1\}}^{+}$. It is easy to see that $C^{\prime \prime}=\mathbb{R}_{+} Q^{\prime \prime}$, where $Q^{\prime \prime}=Q^{\prime}+\mathbb{N}\{(0,0,3)\} . Q^{\prime \prime}$ is a saturated semigroup,
and moreover, $K\left[Q^{\prime \prime}\right]=K\left[\mathcal{A}^{\prime \prime}\right]$, where $\mathcal{A}^{\prime \prime}=\{\{1,2,3\},\{1,2,3\},\{2,3\}\}$. The Danilov-Stanley theorem implies that $R^{\prime \prime}=K\left[Q^{\prime \prime}\right]=K\left[\mathcal{A}^{\prime \prime}\right]$ is Gorenstein and $\omega_{R^{\prime \prime}}=R^{\prime \prime}(-(1,1,1))$. Finally, we remove from $C^{\prime \prime}$ the facet supported by $H_{\{1\}}$. We obtain the cone $C^{\prime \prime \prime}=H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{3,1\}}^{+}$which is a cone over $Q^{\prime \prime \prime}=Q^{\prime \prime}+\mathbb{N}\{(3,0,0)\} . Q^{\prime \prime \prime}$ is the saturated semigroup associated to the ring $R^{\prime \prime \prime}=K\left[\mathcal{A}^{\prime \prime \prime}\right]$, where $\mathcal{A}^{\prime \prime \prime}=\{\{1,2,3\},\{1,2,3\},\{1,2,3\}\}$. Also, $\omega_{R^{\prime \prime \prime}}=R^{\prime \prime \prime}(-(1,1,1))$.

Thus the base ring associated to the transversal polymatroids presented by $\mathcal{A}, \mathcal{A}^{\prime}, \mathcal{A}^{\prime \prime}, \mathcal{A}^{\prime \prime \prime}$ are Gorenstein rings and for $\mathcal{A}_{\mathbf{1}}=\{\{1,2\},\{2,3\}\}$ the base ring presented by $\mathcal{A}_{\mathbf{1}}$ is the Segre product $k\left[t_{11}, t_{12}\right] * k\left[t_{21}, t_{22}\right]$, thus is a Gorenstein ring. All of them have dimension 3.

The computations made so far make us believe that all polymatroids with Gorenstein base ring in dimension 3 are the ones classified above.

## Dimension 4.

We consider the collection of sets $\mathcal{A}=\{\{1,2\},\{2,3\},\{3,4\},\{4,1\}\}$. The base ring associated to the transversal polymatroid presented by $\mathcal{A}$ is

$$
R=K[\mathcal{A}]=K\left[x_{i_{1}} x_{i_{2}} x_{i_{3}} x_{i_{4}} \mid i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, i_{3} \in\{3,4\}, i_{4} \in\{4,1\}\right] .
$$

From [9], $R$ is a normal ring.
We can see $R=K[Q]$, where

$$
Q=\mathbb{N}\left\{\log \left(x_{i_{1}} x_{i_{2}} x_{i_{3}} x_{i_{4}}\right) \mid i_{1} \in\{1,2\}, i_{2} \in\{2,3\}, i_{3} \in\{3,4\}, i_{4} \in\{4,1\}\right\}
$$

Our aim is to describe the facets of $C=\mathbb{R}_{+} Q$. Using Normaliz we obtain 12 facets of the cone $C=\mathbb{R}_{+} Q$ :

$$
\begin{gathered}
H_{\{1\}}:-x_{1}+x_{2}+x_{3}+x_{4}=0, \\
H_{\{2\}}: x_{1}-x_{2}+x_{3}+x_{4}=0, \\
H_{\{3\}}: x_{1}+x_{2}-x_{3}+x_{4}=0, \\
H_{\{4\}}: x_{1}+x_{2}+x_{3}-x_{4}=0, \\
H_{\{1,2\}}:-x_{1}-x_{2}+3 x_{3}+3 x_{4}=0, \\
H_{\{2,3\}}: 3 x_{1}-x_{2}-x_{3}+3 x_{4}=0, \\
H_{\{3,4\}}: 3 x_{1}+3 x_{2}-x_{3}-x_{4}=0,
\end{gathered}
$$

$$
\begin{gathered}
H_{\{1,4\}}:-x_{1}+3 x_{2}+3 x_{3}-x_{4}=0, \\
\\
H_{\{1,2,3\}}: x_{4}=0 \\
\\
H_{\{2,3,4\}}: x_{1}=0 \\
\\
H_{\{1,3,4\}}: x_{2}=0 \\
\\
H_{\{1,2,4\}}: x_{3}=0
\end{gathered}
$$

It is easy to see that $C=H_{\{1\}}^{+} \cap H_{\{2\}}^{+} \cap H_{\{3\}}^{+} \cap H_{\{4\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap$ $H_{\{3,4\}}^{+} \cap H_{\{1,4\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$. Since $(1,1,1,1)$ is the only point in $\operatorname{ri}\left(\mathbb{R}_{+} Q\right)$, then, by Danilov-Stanley theorem, $R$ is a Gorenstein ring and $\omega_{R}=R(-(1,1,1,1))$.

Now we want to proceed as in the case of dimension 3 to get a large class of transversal polymatroids with Gorenstein base ring. Using Normaliz, we can give a complete description, modulo a permutation, of the transversal polymatroids with Gorenstein base ring when we start with

$$
\mathcal{A}=\{\{1,2\},\{2,3\},\{3,4\},\{4,1\}\}
$$

For $\mathcal{A}_{\mathbf{1}}=\{\{1,2,3\},\{2,3\},\{3,4\},\{4,1\}\}$, the associated cone is: $C_{1}=H_{\{1\}}^{+} \cap H_{\{2\}}^{+} \cap H_{\{4\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,4\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap$ $H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{2}}=\{\{1,2,3,4\},\{2,3\},\{3,4\},\{4,1\}\}$, the associated cone is: $C_{2}=H_{\{1\}}^{+} \cap H_{\{2\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,4\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap$ $H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{3}}=\{\{1,2,3,4\},\{2,3,4\},\{3,4\},\{4,1\}\}$, the associated cone is: $C_{3}=H_{\{1\}}^{+} \cap H_{\{2\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{4}}=\{\{1,2,3,4\},\{1,2,3,4\},\{3,4\},\{4,1\}\}$, the associated cone is: $C_{4}=H_{\{2\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}} \cap H_{\{1,3,4\}} \cap H_{\{1,2,4\}}$.

For $\mathcal{A}_{\mathbf{5}}=\{\{1,2,3,4\},\{1,2,3,4\},\{1,3,4\},\{4,1\}\}$, the associated cone is: $C_{5}=H_{\{2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{6}}=\{\{1,2,3,4\},\{1,2,3,4\},\{1,2,3,4\},\{4,1\}\}$, the associated cone is: $C_{6}=H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\boldsymbol{7}}=\{\{1,2,3,4\},\{1,2,3,4\},\{1,2,3,4\},\{1,2,3,4\}\}$, the associated cone is: $C_{7}=H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{8}}=\{\{1,2,3\},\{1,2,3\},\{3,4\},\{4,1\}\}$, the associated cone is: $C_{8}=H_{\{2\}}^{+} \cap H_{\{4\}}^{+} \cap H_{\{1,2\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{9}}=\{\{1,2,3\},\{1,2,3\},\{1,3,4\},\{4,1\}\}$, the associated cone is: $C_{9}=H_{\{2\}}^{+} \cap H_{\{4\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{1 0}}=\{\{1,2,3\},\{1,2,3\},\{1,2,3,4\},\{4,1\}\}$, the associated cone is: $C_{10}=H_{\{4\}}^{+} \cap H_{\{2,3\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{\mathbf{1 1}}=\{\{1,2,3\},\{1,2,3\},\{1,3,4\},\{1,3,4\}\}$, the associated cone is: $C_{11}=H_{\{2\}}^{+} \cap H_{\{4\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

For $\mathcal{A}_{12}=\{\{1,2,3\},\{1,2,3\},\{1,3,4\},\{1,3,4\}\}$, the associated cone is: $C_{12}=H_{\{4\}}^{+} \cap H_{\{1,2,3\}}^{+} \cap H_{\{2,3,4\}}^{+} \cap H_{\{1,3,4\}}^{+} \cap H_{\{1,2,4\}}^{+}$.

The next four examples of transversal polymatroids with Gorenstein base ring are different from those already described.

For $\mathcal{A}_{\mathbf{1 3}}=\{\{1,2,3\},\{2,3,4\}\}$, the Hilbert series of base ring $K\left[\mathcal{A}_{\mathbf{1 3}}\right]$ is:

$$
H_{K\left[\mathcal{A}_{\mathbf{1 3}}\right]}(t)=\frac{1+4 t+t^{2}}{(1-t)^{4}}
$$

For $\mathcal{A}_{\mathbf{1 4}}=\{\{1,2,3,4\},\{2,3,4\}\}$, the Hilbert series of base ring $K\left[\mathcal{A}_{\mathbf{1 4}}\right]$ is:

$$
H_{K\left[\mathcal{A}_{14}\right]}(t)=\frac{1+5 t+t^{2}}{(1-t)^{4}}
$$

For $\mathcal{A}_{\mathbf{1 5}}=\{\{1,2,3,4\},\{1,2,3,4\}\}$, the Hilbert series of base ring $K\left[\mathcal{A}_{\mathbf{1 5}}\right]$ is:

$$
H_{K\left[\mathcal{A}_{1 \mathbf{5}}\right]}(t)=\frac{1+6 t+t^{2}}{(1-t)^{4}}
$$

For $\mathcal{A}_{\mathbf{1 6}}=\{\{1,2\},\{2,3\},\{3,4\}\}$, the Hilbert series of base ring $K\left[\mathcal{A}_{\mathbf{1 6}}\right]$ is:

$$
H_{K\left[\mathcal{A}_{\mathbf{1 6}}\right]}(t)=\frac{1+4 t+t^{2}}{(1-t)^{4}}
$$

It seems that also, in the dimension 4, our examples cover all transversal polymatroids with Gorenstein base ring.
